Deterministic Finite Automata

And Regular Languages

Deterministic Finite Automaton (DFA)

Transition Graph

Alphabet
$$\Sigma = \{a, b\}$$

$$a, b$$

$$q_5$$

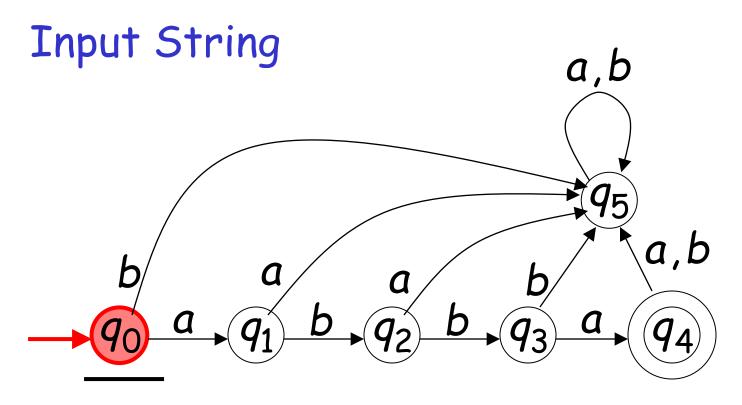

For every state, there is a transition for every symbol in the alphabet

head

Initial Configuration

Input Tape

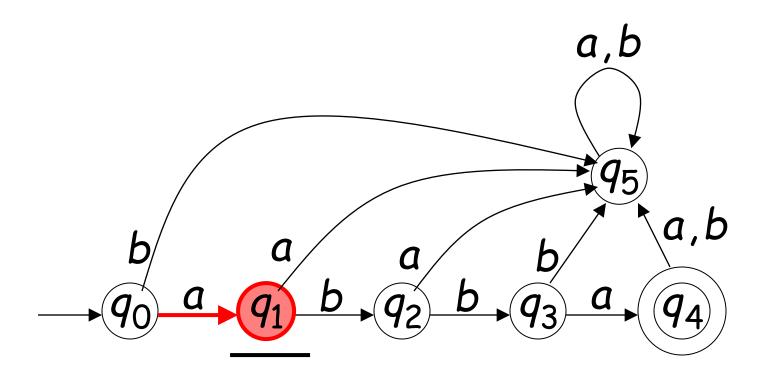

a b b a

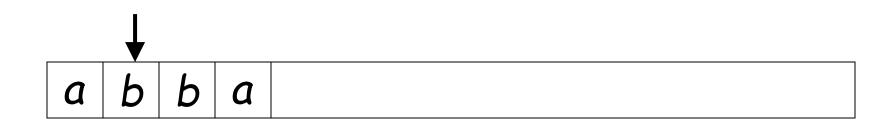

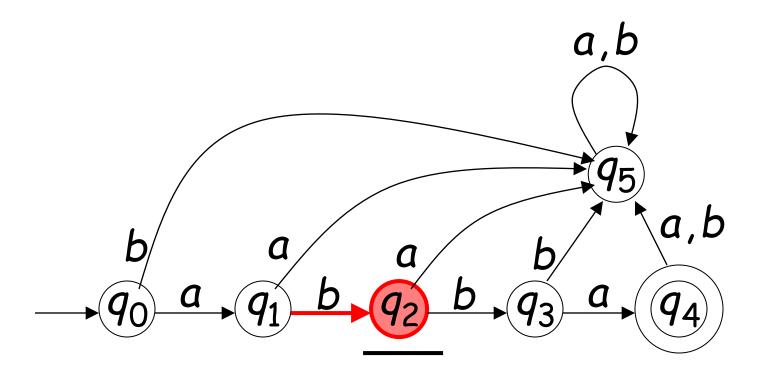

Initial state

Scanning the Input

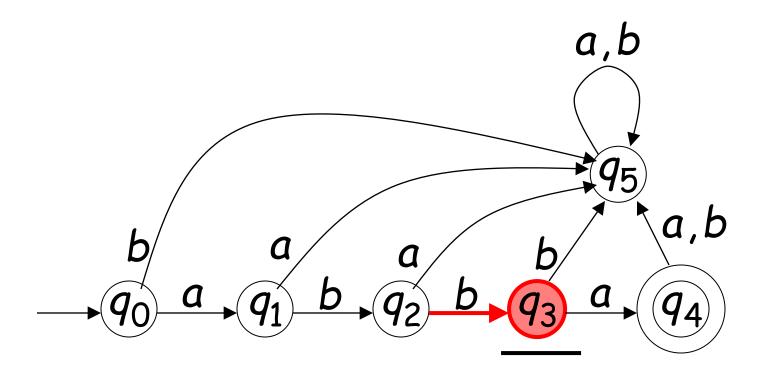

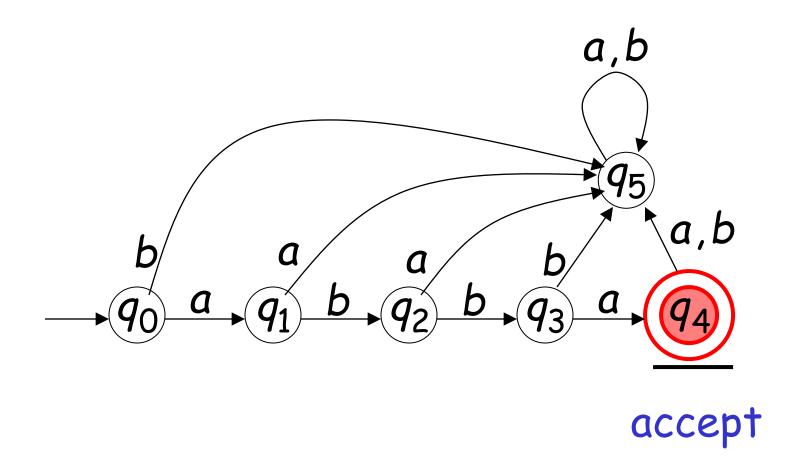

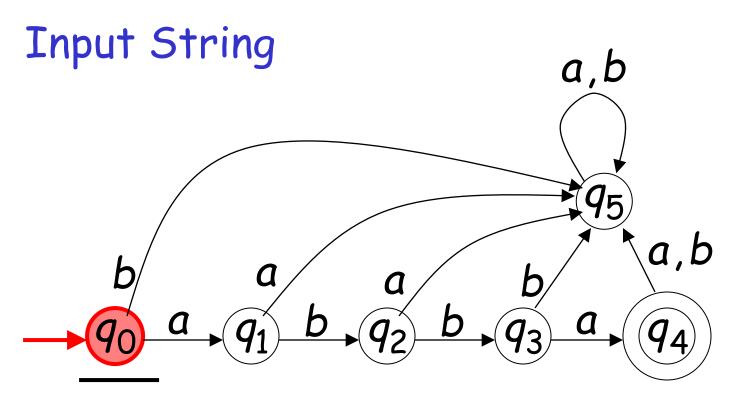

Input finished

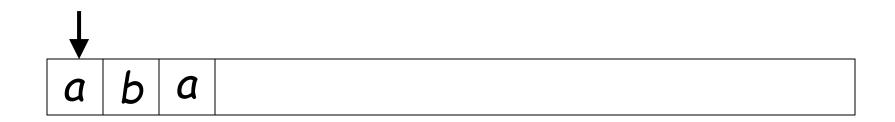

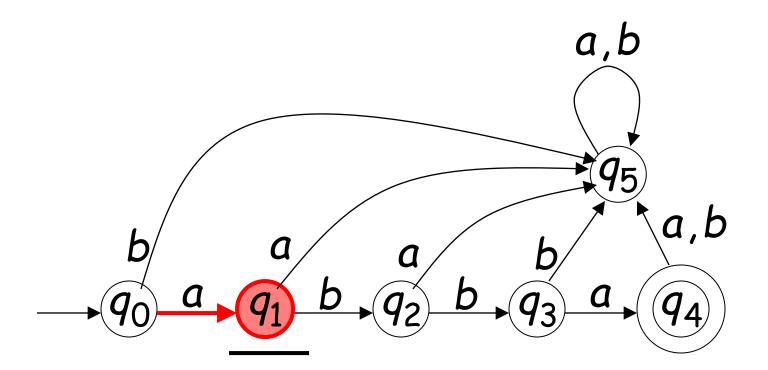

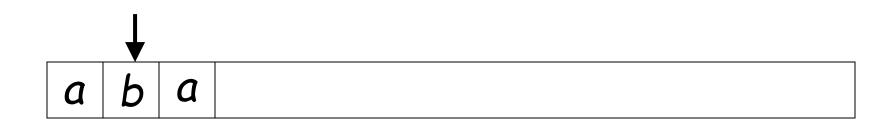

A Rejection Case

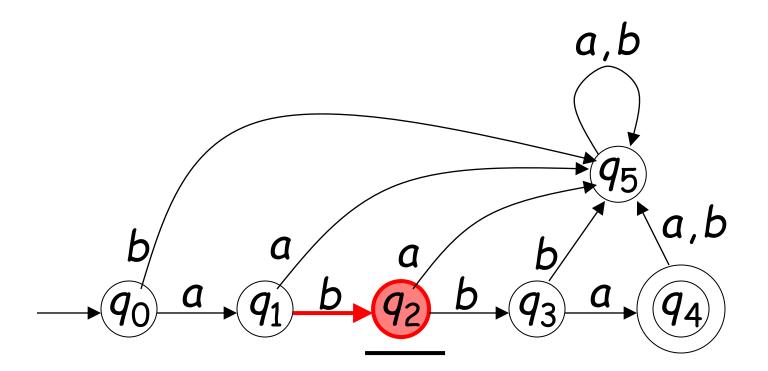

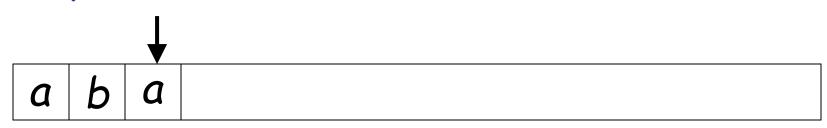

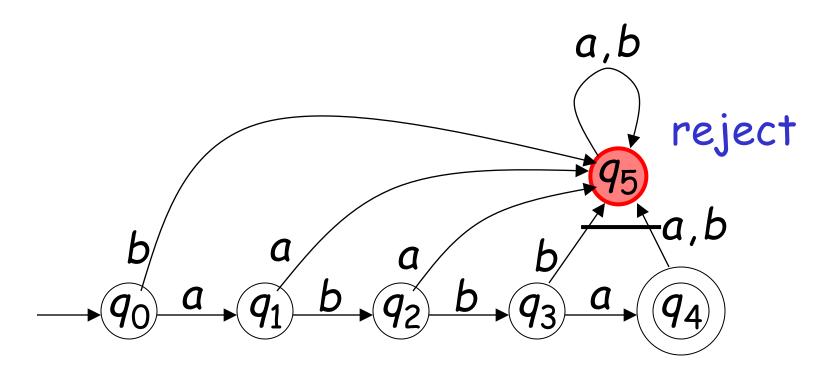

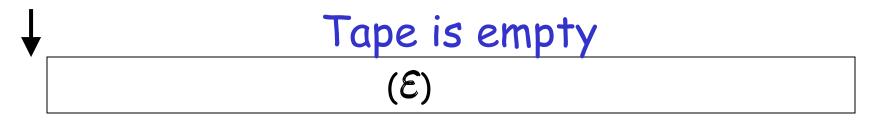

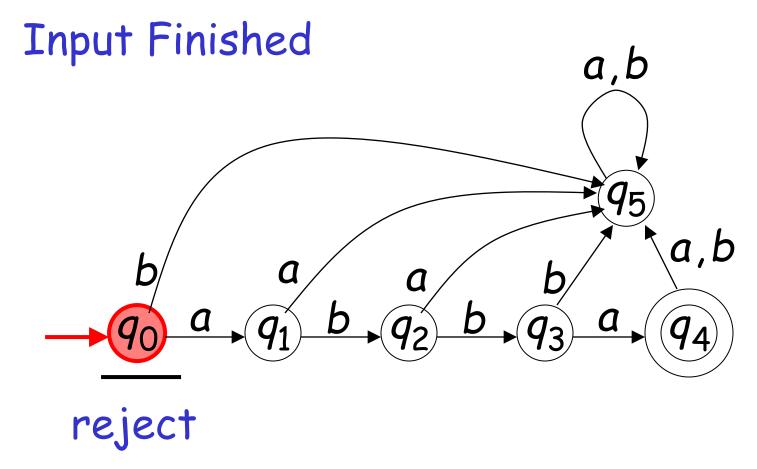

Input finished

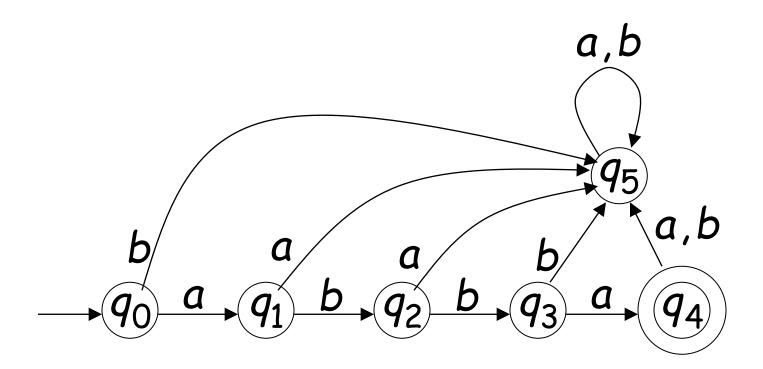

Another Rejection Case

Language Accepted: $L = \{abba\}$

To accept a string:

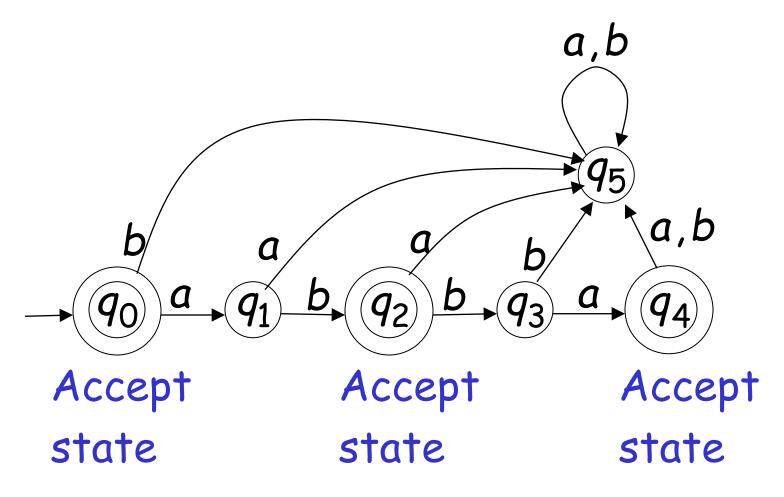

all the input string is scanned and the last state is accepting

To reject a string:

all the input string is scanned and the last state is non-accepting

Another Example

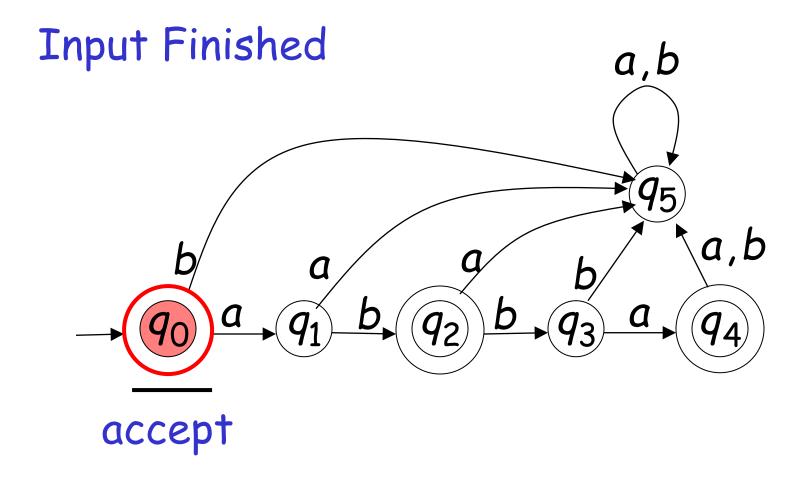

$$L = \{ \mathcal{E}, ab, abba \}$$

 \downarrow

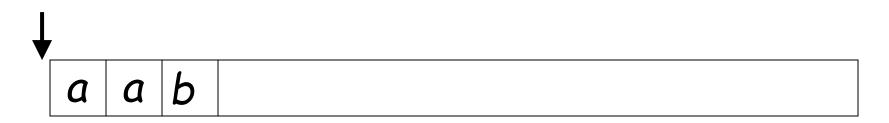

Empty Tape

 (\mathcal{E})

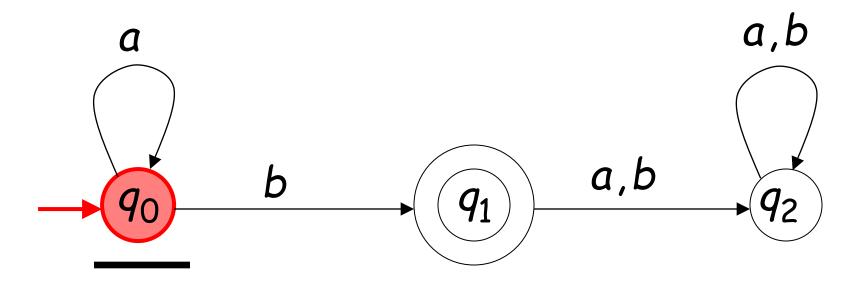

Another Example

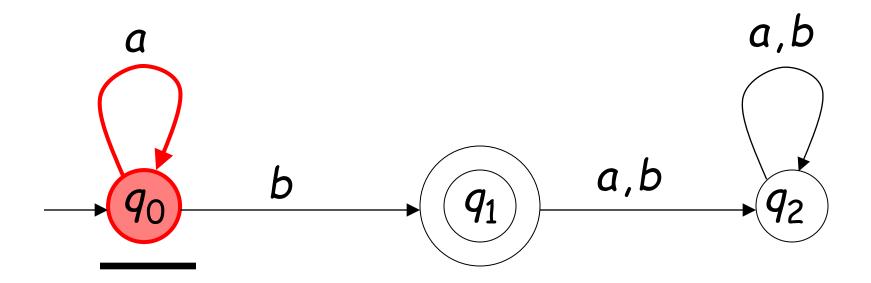

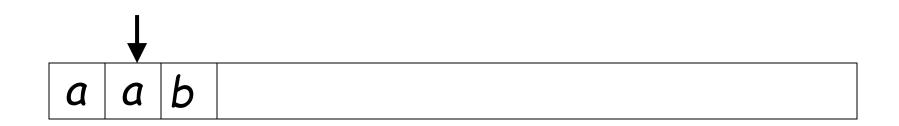

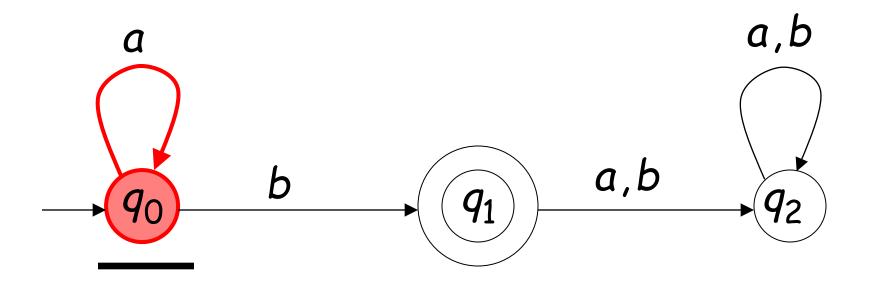

Input String

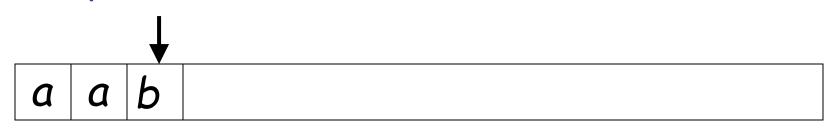

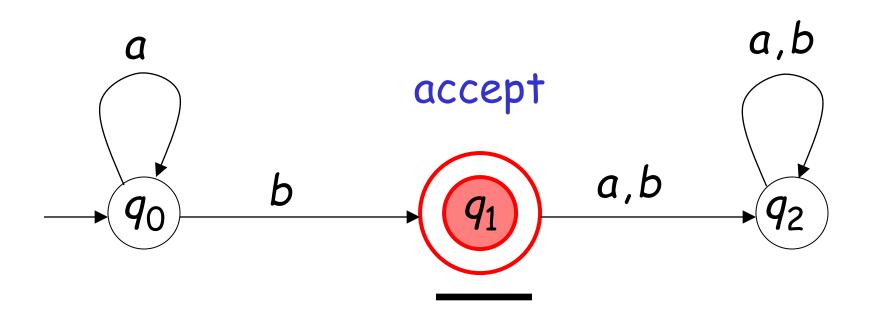

Input finished

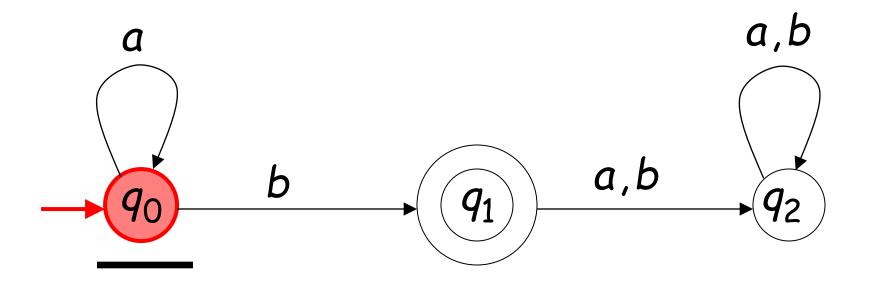

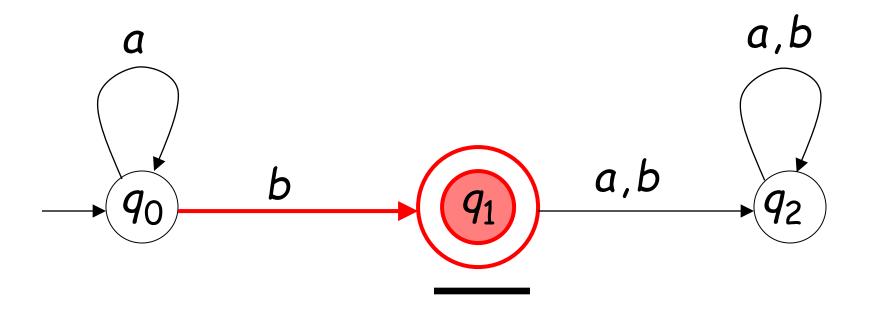

A rejection case

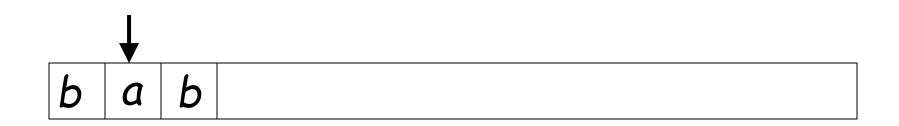

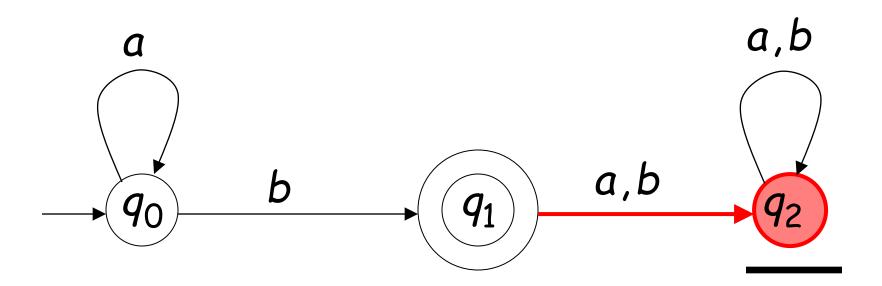

Input String

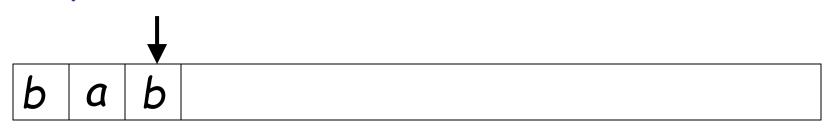

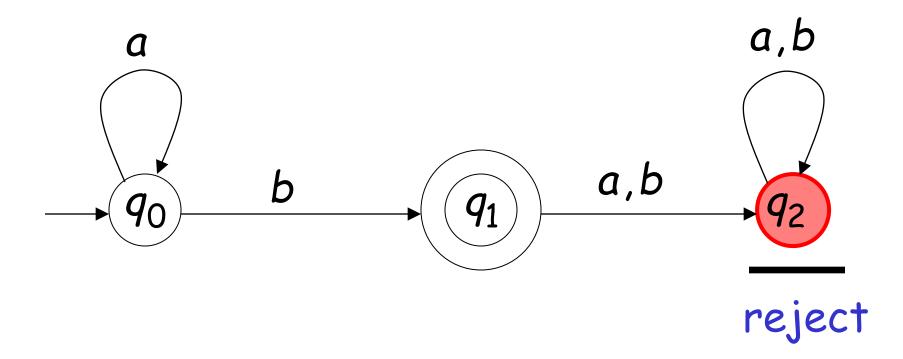

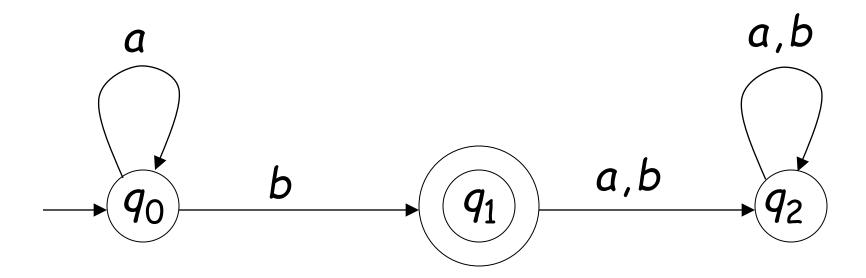

Input finished

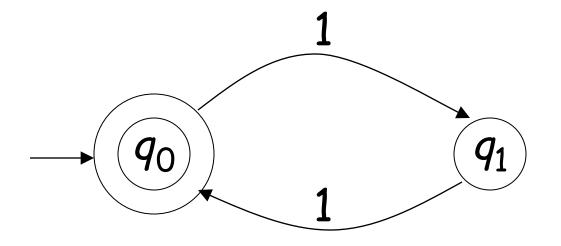

Language Accepted: $L = \{a^nb : n \ge 0\}$

Another Example

Alphabet:
$$\Sigma = \{1\}$$

Language Accepted:

$$EVEN = \{x : x \in \Sigma^* \text{ and } x \text{ is even}\}\$$

= $\{\mathcal{E}, 11, 1111, 111111, ...\}$

Formal Definition

Deterministic Finite Automaton (DFA)

$$M = (Q, \Sigma, \delta, q_0, F)$$

Q: set of states

 Σ : input alphabet $\mathcal{E} \not\in \Sigma$

 δ : transition function

 q_0 : initial state

F: set of accepting states

Set of States Q

Example

$$Q = \{q_{0}, q_{1}, q_{2}, q_{3}, q_{4}, q_{5}\}$$

$$a, b$$

$$a, b$$

$$a + q_{5}$$

$$a, b$$

$$a + q_{5}$$

$$a + q_{1}$$

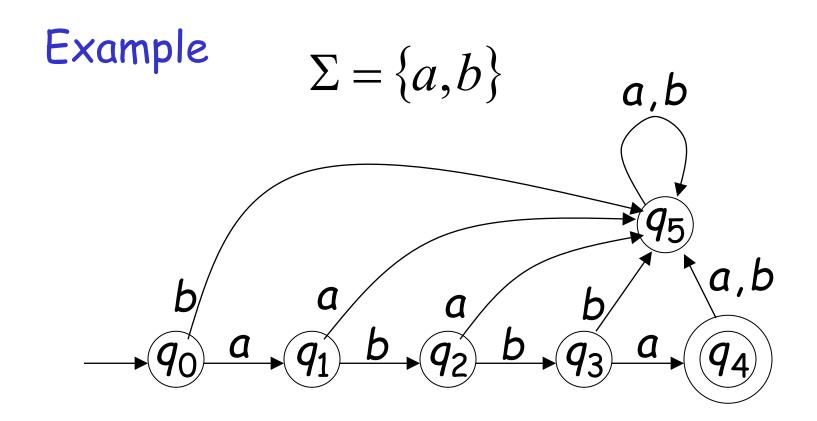

$$b + q_{2}$$

$$b + q_{3}$$

$$a + q_{4}$$

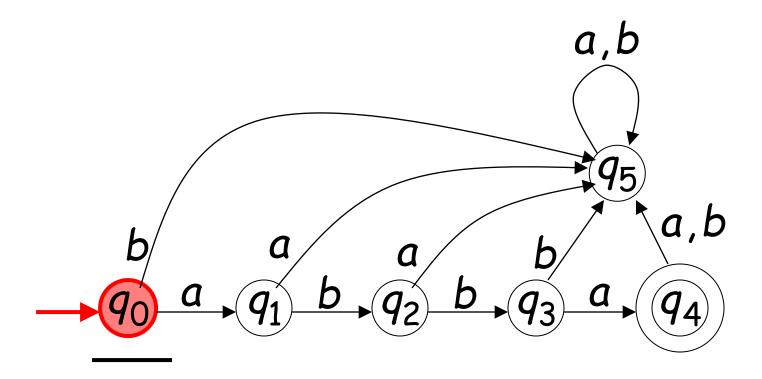

Input Alphabet Σ

 $\mathcal{E}_{\ell} \not\in \Sigma$: the input alphabet never contains \mathcal{E}_{ℓ}

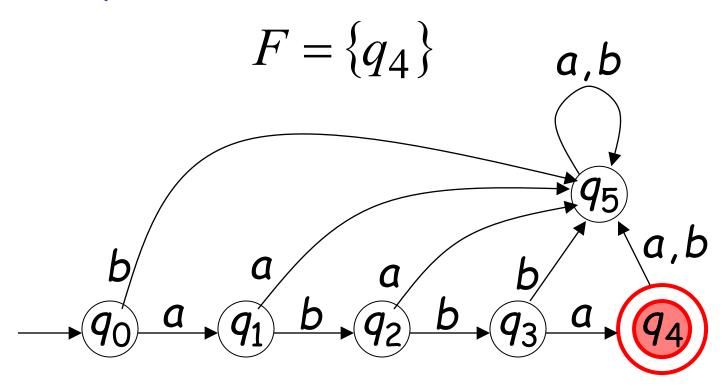

Initial State q_0

Example

Set of Accepting States $F \subseteq Q$

Example

Transition Function $\delta: Q \times \Sigma \to Q$

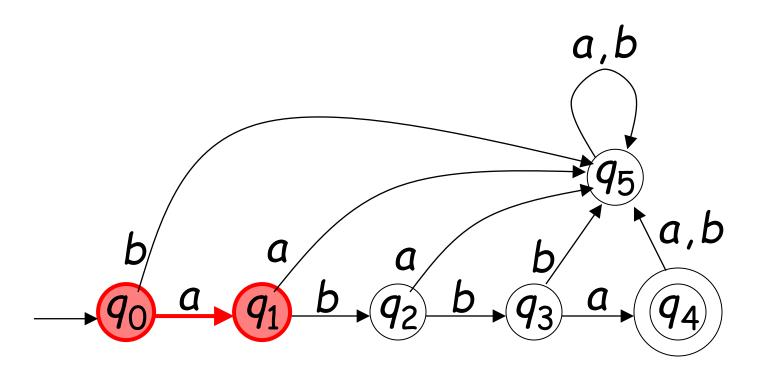

$$\delta(q,x)=q'$$

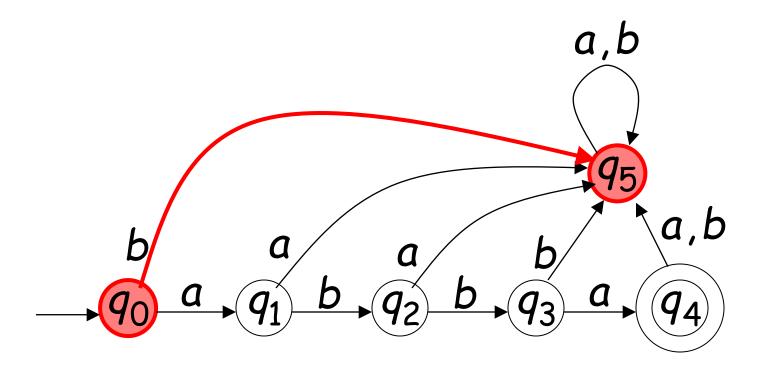

Describes the result of a transition from state q with symbol x

Example:

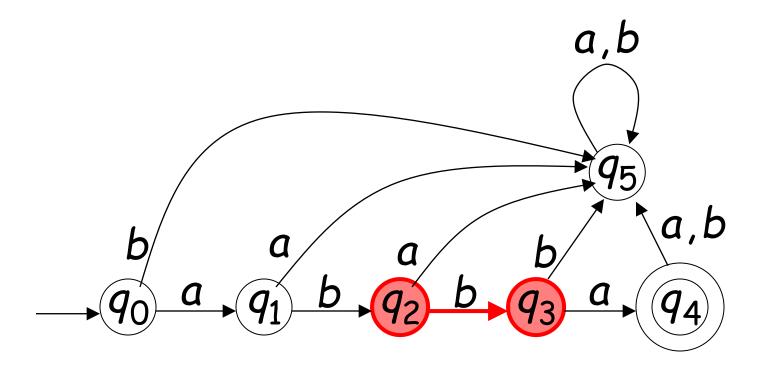

$$\delta(q_0,a)=q_1$$

$$\delta(q_0,b)=q_5$$

$$\delta(q_2,b)=q_3$$

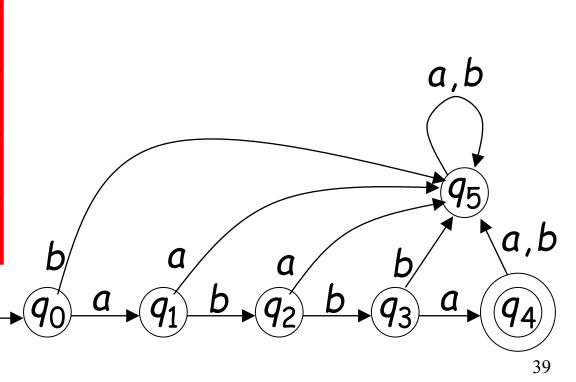

Transition Table for δ

symbols

а	Ь
q_1	q ₅
9 5	92
q_5	<i>q</i> ₃
<i>q</i> ₄	q ₅
<i>q</i> ₅	q ₅
<i>q</i> ₅	q ₅
	 q₁ q₅ q₄ q₅

states

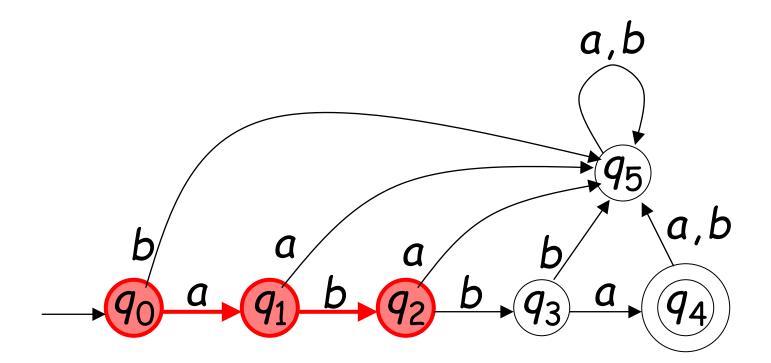

Extended Transition Function

$$\delta^*: \mathbf{Q} \times \Sigma^* \to \mathbf{Q}$$

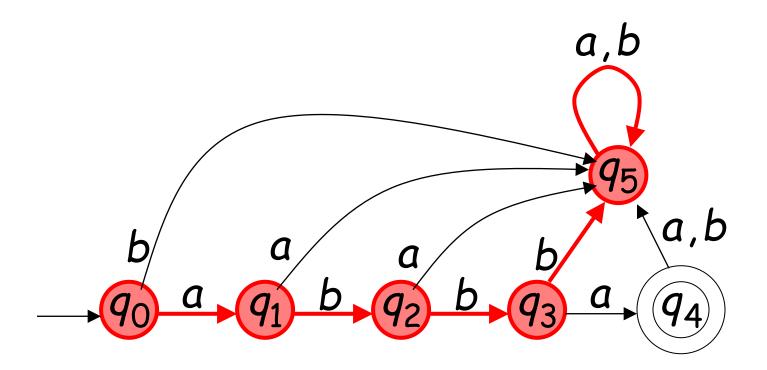

$$\delta^*(q,w)=q'$$

Describes the resulting state after scanning string W from state q

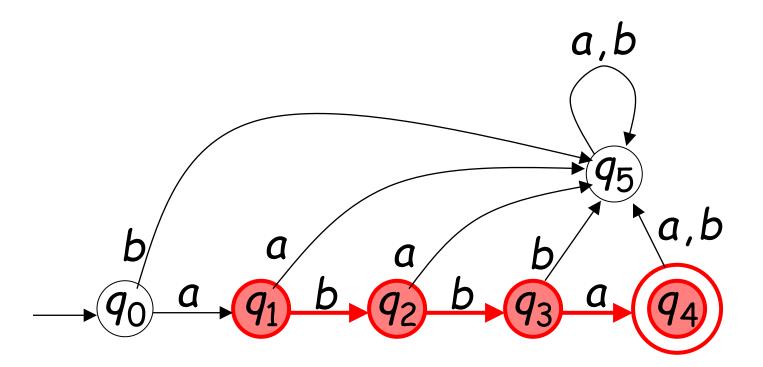

Example:
$$\delta^*(q_0,ab) = q_2$$

$$\delta^*(q_0,abbbaa) = q_5$$

$$\delta^*(q_1,bba)=q_4$$

Special case:

for any state q

$$\delta^*(q,\mathcal{E}) = q$$

$$\delta^*(q,w)=q'$$

implies that there is a walk of transitions

Language Accepted by DFA

Language of DFA M:

it is denoted as L(M) and contains all the strings accepted by M

We say that a language
$$L'$$
 is accepted (or recognized) by DFA M if $L(M) = L'$

For a DFA
$$M = (Q, \Sigma, \delta, q_0, F)$$

Language accepted by M:

$$L(M) = \{ w \in \Sigma^* : \delta^*(q_0, w) \in F \}$$

$$q_0 \qquad \qquad q' \in F$$

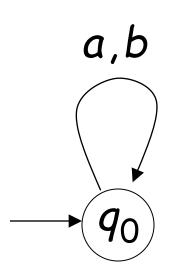

Language rejected by M:

$$\overline{L(M)} = \{ w \in \Sigma^* : \delta^*(q_0, w) \notin F \}$$

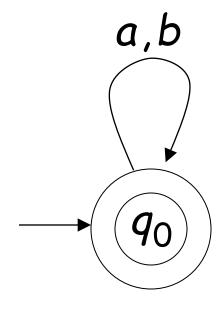

More DFA Examples

$$\Sigma = \{a,b\}$$

$$L(M) = \{ \}$$

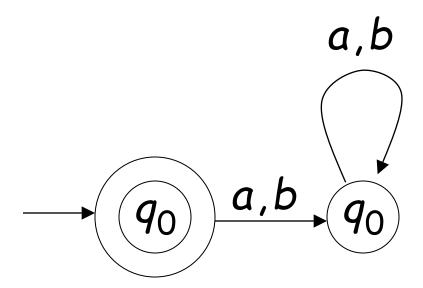

Empty language

$$L(M) = \Sigma^*$$

All strings

$$\Sigma = \{a,b\}$$

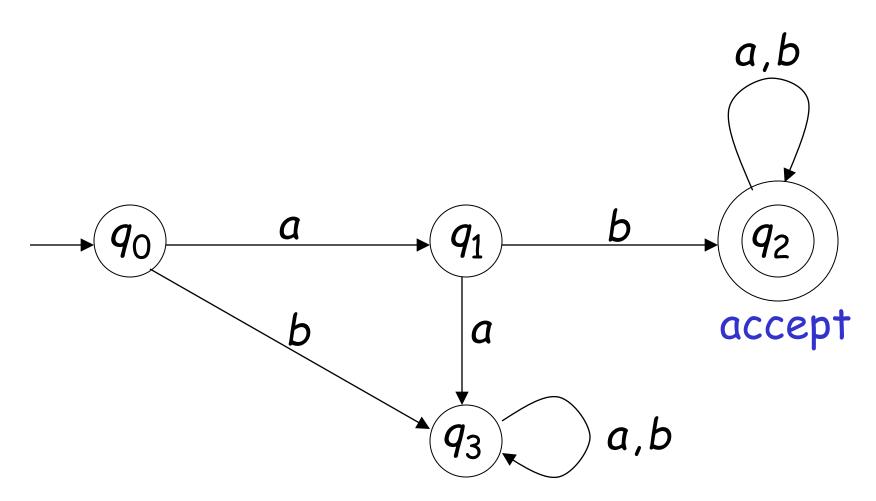

$$L(M) = \{\mathcal{E}\}$$

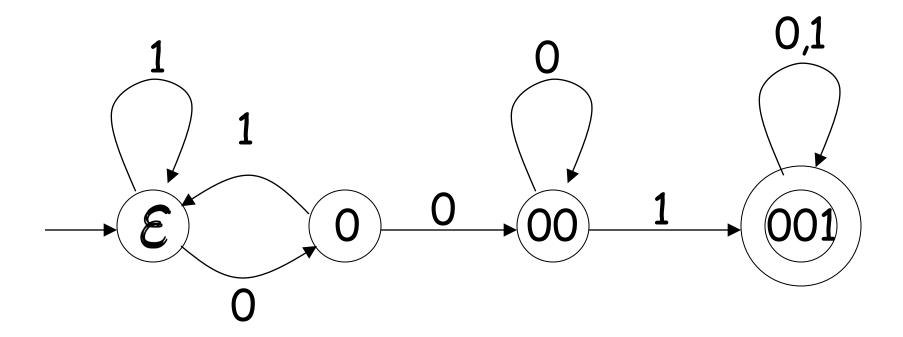

Language of the empty string

$$\Sigma = \{a,b\}$$

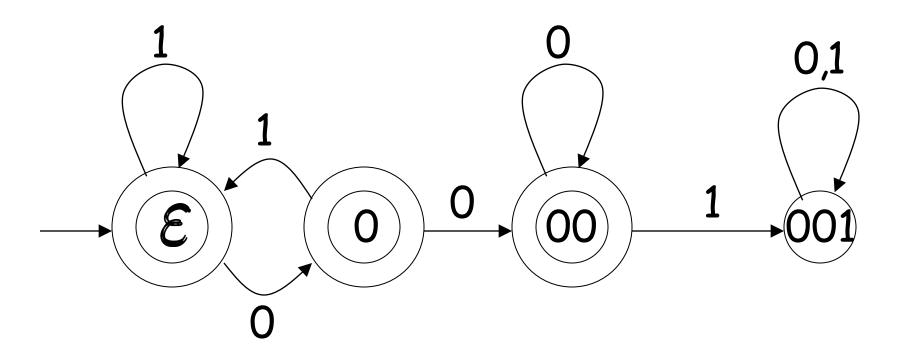

L(M)= { all strings with prefix ab }

$L(M) = \{ all binary strings containing substring 001 \}$

$L(M) = \{ all binary strings without substring 001 \}$

$$L(M) = \left\{awa : w \in \left\{a,b\right\}^*\right\}$$

$$q_0 = \left\{a,b\right\}^*$$

$$q_2 = \left\{a,b\right\}^*$$

$$q_3 = \left\{a,b\right\}^*$$

$$q_4 = \left\{a,b\right\}^*$$

$$q_4 = \left\{a,b\right\}^*$$

Regular Languages

Definition:

```
A language L is regular if there is a DFA M that accepts it (L(M) = L)
```

The languages accepted by all DFAs form the family of regular languages

Example regular languages:

```
\{abba\} \{\mathcal{E}, ab, abba\}
\{a^n b : n \ge 0\} \{awa : w \in \{a,b\}^*\}
{ all strings in \{a,b\}^* with prefix ab }
{ all binary strings without substring 001}
\{x:x\in\{1\}^* \text{ and } x \text{ is even}\}
\{\} \{\mathcal{E}\} \{a,b\}^*
```

There exist automata that accept these languages (see previous slides).

There exist languages which are not Regular:

$$L=\{a^nb^n:n\geq 0\}$$

ADDITION =
$$\{x + y = z : x = 1^n, y = 1^m, z = 1^k, n + m = k\}$$

There is no DFA that accepts these languages

(we will prove this in a later class)
