Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.

Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.

Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.

Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.

Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.

Table 1 (Continued)

Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.

Table 1. Performance of our transitive reduction algorithm on simulated biological networks. We first generate the random network and then apply our algorithm for BTR to get a reduced network. The subsequent columns show the results when a certain number of edges are added randomly that do not change an optimal solution of the original graph.
